1 GameCo: Marketing Budget Recommendation

A regional sales analysis revisiting GameCo's assumptions about its largest markets, and a data-backed recommendation for reallocating marketing budget.

Marketing Budget Recommendation - GameCo

Sumeet Telgote.

Slide 1 — Title slide

Current Understanding

GameCo's current understanding assumes that **North America and Japan have consistently been the two largest contributors to global video game sales**, with Europe playing a secondary role. Based on this assumption, marketing investments have historically focused on North America and Japan, with the expectation that regional sales shares have remained relatively stable over time.

Slide 2 — Current understanding — GameCo's existing assumption that North America and Japan are the two largest markets, with Europe secondary

Histogram

A highly right-skewed distribution driven by a small number of exceptionally successful titles, reinforces the need to focus on proportional trends rather than being misled by a few blockbuster games.

Slide 3 — Histogram — distribution of NA sales, strongly right-skewed and driven by a small number of blockbuster titles

Line Chart

A line chart of regional sales proportions over time clearly showed Europe's steady rise and its overtaking of Japan around 1997.

Slide 4 — Line chart — regional sales proportions over time, showing Europe's steady rise and its overtaking of Japan around 1997

Bar Chart

A bar chart comparing regional proportions from 2011-2016 confirmed that Europe's stronger position was not a temporary fluctuation.

Slide 5 — Bar chart — regional sales proportions by genre, 2011–2016, confirming Europe's stronger position was not a temporary fluctuation

Key Insights

The data shows that while **North America consistently remains the largest market**, **Europe's share of global sales increased steadily and surpassed Japan's around 1997**. This shift was not temporary—Europe maintained a higher share than Japan through the most recent years of available data. This finding challenges the assumption that Japan has consistently been GameCo's second-largest market.

Slide 6 — Key insights — North America remains the largest market, but Europe surpassed Japan around 1997 and sustained that lead

Revised Understanding

GameCo should revise its understanding to recognize that **Europe is now a core market alongside North America**, while **Japan represents a smaller and more specialized share of global sales** than previously assumed. Regional importance has shifted over time rather than remaining static.

Slide 7 — Revised understanding — Europe is now a core market alongside North America; Japan represents a smaller, more specialized share

Recommendation

GameCo should **reallocate marketing budgets to reflect Europe's sustained growth**, investing more heavily in localization, distribution, and regional campaigns across European markets. At the same time, Japan should be approached with **more targeted, niche-focused strategies** rather than broad investment. This realignment will better position GameCo to maximize returns in 2017 and beyond.

Slide 8 — Recommendation — reallocate marketing budget toward Europe's sustained growth, while approaching Japan with more targeted, niche strategies

2 Project Reflection

The key insight highlighted in this analysis is that Europe's share of global video game sales increased steadily over time and eventually surpassed Japan's in the late 1990s. This finding challenges the assumption that sales for the various geographic regions have stayed the same over time. This helps in understanding how future marketing resources should be allocated, and it is especially important for GameCo's leadership.

To arrive at this conclusion, I first organized the dataset by year and summarized sales across North America, Europe, Japan, and the global market. Using pivot tables, I calculated annual totals for each region and then created new variables that expressed each region's sales as a percentage of global sales. This proportional view made it easier to identify long-term structural changes that absolute sales numbers might obscure.

I then examined summary statistics — such as the mean, median, range, and IQR — for North American sales. The results showed a strongly right-skewed distribution driven by a small number of exceptionally successful titles. This reinforced the need to focus on proportional trends rather than being misled by a few blockbuster games.

Two visualizations were especially influential in shaping the final insight. A line chart of regional sales proportions over time clearly showed Europe's steady rise and its overtaking of Japan around 1997. A subsequent bar chart comparing regional proportions in later years confirmed that Europe's stronger position was not a temporary fluctuation.

For the final presentation, these visuals were refined to enhance clarity and executive usability. The line chart highlights changes over time, while the bar chart provides an easy way to compare regions directly. Together, they make Europe's growing strategic importance immediately visible and actionable for GameCo's decision-makers.
